Project Path Classification Standard

AID-SPC-001

1. Purpose

This standard defines how AIDOOi classifies the customer's first furnishing selection into a clear project path. Its purpose is to keep the customer experience simple while ensuring that the backend routes each request to the correct subsequent question flow.

2. Customer Entry Question

What are you furnishing?

The customer selects one of eight entry options. This first selection is sufficient to determine the high-level project path. AIDOOi must not ask the customer to repeat information that is already clear from this selection.

3. Project Path Classification

Customer Selection	Project Path
Living Room	Room Path
Bedroom	Room Path
Dining Room	Room Path
Home Office	Room Path
Studio Apartment	Whole Property Path
Full Apartment	Whole Property Path
Villa	Whole Property Path
Individual Product	Product Path

4. Core Routing Rule

The customer's Step 1 selection determines the project path and the subsequent question flow.

Room Path: Used when the customer selects Living Room, Bedroom, Dining Room, or Home Office. The next questions must focus directly on the selected room and its furnishing requirements.

Whole Property Path: Used when the customer selects Studio Apartment, Full Apartment, or Villa. The next questions must focus on the property itself, such as size, room count where applicable, floor plan, and other information required to furnish the complete property. AIDOOi must not ask which room the customer wants to furnish, because the initial selection already indicates a whole-property request.

Product Path: Used when the customer selects Individual Product. The next questions must identify the required product type and the information necessary for product-level recommendation.

5. UX and Data Principle

The customer-facing interface may remain simple and use the eight direct choices above. The backend must normalize each choice into one of the three controlled project paths. Backend structure must support the

recommendation engine without adding unnecessary questions to the customer journey.

6. Scope of This Standard

AID-SPC-001 defines only the high-level project-path classification and routing logic. Detailed questions, required fields, and branching rules for Room Path, Whole Property Path, and Product Path are defined in subsequent AID-SPC standards.
