Full Apartment Path Standard

AID-SPC-007 | Revision 2

Revision 2 change: Adds Bedroom Consistency Preference for apartments with two or more bedrooms and aligns the project-budget reference with AID-LOG-007.

1. Purpose

This standard defines the complete customer journey after Full Apartment is selected in AID-SPC-001. The Full Apartment path acts as an orchestration layer: it guides the customer through the relevant room modules, then collects shared project preferences once for the apartment as a whole.

2. Entry Condition

Trigger: Customer selects Full Apartment in the Step 1 question, What are you furnishing? The system must not ask which rooms the customer wants to furnish as a general follow-up, because the selected path already represents the full apartment.

3. Full Apartment Customer Path

Step	Input / Module	Requirement / Reference
1	Number of Bedrooms	Required
2	Bedroom 1 of X	Run Bedroom module - Ref: AID-SPC-003
3	Bedroom 2...X	Repeat Bedroom module for each selected bedroom
4	Bedroom Consistency Preference	Conditional - only if 2+ bedrooms - Same Products / Different Products
5	Dining Room	Run Dining Room module - Ref: AID-SPC-004
6	Living Room	Run Living Room module - Ref: AID-SPC-002
7	Do you need a Home Office?	Required - Yes / No
7A	Home Office	Conditional - if Yes - Ref: AID-SPC-005
8	Overall Style Preference	Project-level - Ref: AID-DATA-009
9	Overall Colour Preference	Project-level - Ref: AID-DATA-007
10	Total Project Budget	Project-level - Ref: AID-LOG-007
11	Whole Apartment Recommendation	Proceed to coordinated apartment recommendation

4. Number of Bedrooms

Number of Bedrooms is required. This value determines how many Bedroom modules are created. The interface should clearly show progress, for example Bedroom 1 of 3, Bedroom 2 of 3, and Bedroom 3 of 3.

5. Reusable Room Modules

Each bedroom must use the spatial and bedroom-specific inputs already defined in AID-SPC-003, including room dimensions and Preferred Bed Size. After all bedrooms are completed, the customer proceeds to the Dining Room module under AID-SPC-004, followed by the Living Room module under AID-SPC-002.

6. Bedroom Consistency Preference

When the apartment contains two or more bedrooms, AIDOOi asks: How would you like the bedrooms to be furnished?

Option	Customer Meaning	System Behaviour
Same Products	The customer prefers repeated furniture products across bedrooms.	Use the same products where room dimensions, Preferred Bed Size, fit and availability allow.
Different Products	The customer prefers different furniture selections for each bedroom.	Allow different products while maintaining the apartment's Overall Style, Overall Colour Direction and design coherence.

> **Rule: Same Products is a preference, not a fit override. AIDOOi must not compromise bed size, room fit or circulation merely to repeat an identical product. The detailed recommendation behaviour is governed by AID-LOG-007.**

7. Home Office Branch

After the core apartment rooms are completed, AIDOOi asks Do you need a Home Office? with Yes / No options. If Yes, the customer enters the Home Office module defined in AID-SPC-005. If No, the path continues directly to project-level preferences.

8. No Total Apartment Area Requirement

Total apartment area is not required in this path. The dimensions needed for product fit and recommendation are collected within the relevant Bedroom, Dining Room, Living Room, and conditional Home Office modules. This avoids redundant customer input.

9. Shared Project Preferences

Style, Colour, and Budget are collected once at project level after the room modules are completed. Overall Style Preference follows AID-DATA-009, Overall Colour Preference follows AID-DATA-007, and Total Project Budget follows AID-LOG-007.

10. Module Override Rule

When AID-SPC-002, AID-SPC-003, AID-SPC-004, or AID-SPC-005 is invoked from the Full Apartment path, their room-specific spatial and practical inputs are reused, but their standalone Style, Colour, and Budget steps are not asked again. The Full Apartment path controls these shared preferences at project level.

11. Recommendation Handoff

After all required room modules, Bedroom Consistency Preference when applicable, and shared project preferences are complete, AIDOOi proceeds to a coordinated Whole Apartment Recommendation. The recommendation should treat the apartment as one coherent furnishing project rather than a set of unrelated room recommendations.

12. MVP Scope Principle

> **Do not add apartment-level questions that duplicate information already captured inside the room modules. Additional inputs should be introduced only when MVP evidence shows that they materially improve matching or recommendation quality.**
