AID-DATA-004

PRODUCT CLASSIFICATION & TAXONOMY STANDARD

Lean classification framework for AIDOOi product data, search and AI matching

1. Purpose

AIDOOi uses a controlled, lean taxonomy to identify what a product fundamentally is without overloading classification with descriptive attributes. The taxonomy must remain simple enough for reliable data entry while being structured enough for filtering, search and AI matching.

2. Standard Taxonomy Structure

Main Category -> Category -> Subcategory / Product Type

Level	Purpose	Example
Main Category	Broad product family	Seating
Category	Core product class	Chair
Subcategory / Product Type	Functional product type	Lounge Chair

Example

Seating -> Chair -> Lounge Chair

3. Core Principle

Taxonomy answers: What is the product?
Attributes answer: What is it like, what features does it have, and how is it used?

Do not create additional taxonomy levels for colour, material, style, shape, room, storage, armrests, configuration or other characteristics when those can be stored as attributes.

4. Lean Main Category Framework

Main Category	Typical Categories / Product Types
Seating	Chair, Stool, Bench, Ottoman / Pouf, Chaise
Sofas	Sofa, Sectional Sofa, Modular Sofa, Sofa Bed
Tables	Coffee Table, Side Table, Dining Table, Console Table, Desk, Dressing Table
Beds	Bed, Headboard
Storage & Casegoods	Cabinet, Sideboard, Dresser, Wardrobe, Shelving, TV / Media Unit, Shoe Cabinet
Lighting	Floor Lamp, Table Lamp, Pendant, Chandelier, Ceiling Light, Wall Light

Main Category	Typical Categories / Product Types
Rugs & Soft Furnishings	Area Rug, Runner, Cushion, Throw
Decor & Accessories	Mirror, Artwork, Wall Decor, Vase, Decorative Object, Planter, Clock

5. Room Is Not a Taxonomy Level

Room placement should be stored separately as an attribute such as **Suitable Room**. A bedroom bench remains a Bench; a bedside table remains a Table; and a bedroom chest remains Storage. This prevents duplicate classifications and allows one product to be suitable for multiple rooms.

6. Attributes Must Not Inflate the Taxonomy

Information	Store As
Lounge Chair	Subcategory / Product Type
Brown	Colour attribute
Leather	Material attribute
Contemporary	Style attribute
Armrests: Yes	Chair-specific attribute
Seat Depth: 53 cm	Dimension / comfort attribute
Accent use	Optional use / role attribute only if needed for matching

7. MVP Data-Minimisation Rule

Before adding any new taxonomy level or attribute, ask: **Will this data materially improve matching, filtering, visualisation or purchasing?** If not, do not make it a required MVP field. AIDOOi should capture the minimum reliable data needed to produce a strong recommendation.

8. Controlled Vocabulary

Main Category, Category and Subcategory values must come from controlled master lists. Data-entry users should not create alternative spellings or new classifications independently. New types should be reviewed before being added to the taxonomy.

9. Example - AIDOOi Test Chair

Field	Value
Main Category	Seating
Category	Chair
Subcategory / Product Type	Lounge Chair
Primary Style	Contemporary (attribute)
Material	Fabric + leather-look + metal (attribute)
Seat Depth	53 cm (attribute)
Armrests	Yes (attribute)

Final Rule

Keep taxonomy stable, controlled and lean. Classify the product by what it fundamentally is; store descriptive, functional and visual differences as attributes only when they provide real value to AIDOOi matching or commerce.
