AID-DATA-006

PRODUCT DIMENSIONS STANDARD

Universal dimensional rules for product data, space-fit logic and AI recommendations

1. Purpose

This standard defines how product dimensions are captured, normalized, stored and used in AIDOOi. Accurate dimensions are essential for space-fit evaluation, comparison, recommendation quality and future visualization workflows.

2. Universal Required Dimensions

Field	Requirement	Standard Unit
Width	Required	cm
Depth	Required	cm
Height	Required	cm

Width, Depth and Height are universal Product-level fields and should represent the product's overall external dimensions.

3. Standard Unit

Centimetres (cm) are the canonical storage unit for AIDOOi product dimensions. Seller or manufacturer data supplied in millimetres or inches must be converted to centimetres before canonical storage.

4. Decimal Precision

Decimal values are permitted. Store dimensional values with a maximum of **one decimal place** when required to preserve meaningful source accuracy.

Source / Value	Canonical AIDOOi Value
67 cm	67 cm
67.5 cm	67.5 cm
675 mm	67.5 cm
26.6 in	67.6 cm (after conversion and rounding)

Do not display unnecessary trailing zeros. Store/display 67 cm rather than 67.0 cm when there is no fractional value.

5. Measurement Meaning

Field	Meaning
Width	Maximum overall left-to-right external dimension in the product's normal use position.
Depth	Maximum overall front-to-back external dimension in the product's normal use position.
Height	Maximum overall bottom-to-top external dimension in the product's normal use position.

6. Category-Specific Dimensions

Dimensions needed only for particular product categories must remain category-specific attributes rather than expanding the Universal Product Master.

Example Attribute	Applicable Category / Use
Seat Height	Seating / Sofas
Usable Seat Width	Seating / Sofas
Usable Seat Depth	Seating / Sofas

Example Attribute	Applicable Category / Use
Arm Height	Seating / Sofas
Tabletop Thickness	Tables, when useful
Mattress / Sleeping Surface Size	Beds, when applicable

7. Overall Dimension vs Functional Dimension

Overall dimensions and functional dimensions must not be confused. Overall Depth is used for room and clearance fit; a category-specific value such as Usable Seat Depth may be used for comfort and seating analysis.

8. Example - AIDOOi Test Lounge Chair

Dimension	Value	Primary Use
Width	67 cm	Space fit
Overall Depth	83 cm	Space fit / room planning
Height	68 cm	Space fit / visual scale
Seat Height	40 cm	Comfort / ergonomics
Arm Height	57 cm	Comfort / clearance
Usable Seat Width	63 cm	Comfort
Seat Platform Depth	67 cm	Technical seat structure
Usable Seat Depth	53 cm	Seating comfort

9. Source Accuracy and Missing Data

Use verified manufacturer, supplier or reliable physical measurement data whenever possible. Do not invent missing dimensions. If a dimension is unavailable, it must remain missing or be flagged for completion rather than estimated as a confirmed value.

10. AI and Space-Fit Rule

AIDOOi should use the universal Width, Depth and Height fields as the primary dimensional inputs for physical space-fit logic. Category-specific dimensions may provide additional comfort, ergonomic or functional intelligence but do not replace the universal dimensions.

11. Final Standard

Universal storage: Width + Depth + Height.
Canonical unit: cm.
Precision: maximum one decimal place when needed.
Category-specific measurements: stored separately.
No invented dimensions: missing or unverified data must remain clearly unresolved.
