AID-DATA-011

PRODUCT AVAILABILITY & INVENTORY STANDARD

Availability, inventory, physical viewing and delivery rules for Seller Offers

1. Purpose

This standard defines how AIDOOi records whether a Seller Offer can actually be purchased, viewed and delivered. Operational availability belongs primarily to the Seller Offer (AIO), because the same canonical Product (AID) may have different stock, viewing and delivery conditions across sellers.

2. Core Availability Fields

Field	Requirement	Purpose
Stock Status	Required	Confirms whether the Seller Offer is currently orderable.
Quantity Available	Recommended	Exact sellable quantity when reliable inventory data is available.
Viewing Status	Required	Defines whether and how the exact product/variant can be viewed physically.
Viewing Location	Conditional	Required when the product is available for physical viewing.
Warehouse Location	Recommended / Internal	Operational location of inventory; normally not customer-facing.
Delivery Availability	Required	Defines whether delivery is available, pickup-only, or unavailable.
Estimated Delivery Time	Conditional	Required when delivery is available.
Delivery Cost	Conditional	Required when delivery is available; Free or a confirmed amount.

3. Stock Status

Stock Status is a controlled required field. Low Stock is not manually entered as a primary status; it is derived by the system when reliable quantity data exists.

Status	Definition	Final Four Treatment
In Stock	Currently available and orderable.	Eligible by default.
Out of Stock	Currently unavailable for purchase.	Not shown as a normal purchasable Final Four offer.
Pre-Order	Orderable, but not currently available as ready stock.	Only when the customer journey permits waiting/pre-order.
Discontinued	No longer offered by that seller.	Not eligible as an active purchasable offer.

4. Quantity Available

Quantity Available - Recommended, not Required for MVP. It should contain the actual sellable unit count for that AIO Offer when the seller can provide reliable inventory data. AIDOOi must never guess quantity.

Condition	System Treatment
Quantity = 0	Offer should be treated as Out of Stock.
Quantity = 1 or 2	System may display Low Stock.
Quantity > 2	Normal In Stock presentation unless later rules define another threshold.
Quantity = NULL	In Stock may remain valid, but AIDOOi must not display an invented quantity or Low Stock claim.

5. Physical Viewing - Core AIDOOi Value

Physical viewing is treated as a first-class availability feature because AIDOOi aims to help customers see the real product before purchase whenever possible. Viewing status refers to the exact product/variant, not merely to the existence of a seller showroom.

Viewing Status	Definition
On Display	The exact product/variant is already displayed and can be viewed without special warehouse preparation.
Viewing on Request	The product can be made available for viewing, but preparation, transfer or seller coordination is required.
Not Available to View	The product cannot currently be viewed physically.

6. Viewing Location

Viewing Location is required when Viewing Status is On Display or Viewing on Request. It identifies where the customer can view the exact product. A generic seller showroom address must not be used if that specific product cannot actually be viewed there.

AID-DATA-011

PRODUCT AVAILABILITY & INVENTORY STANDARD

7. Viewing on Request - Operational Protection

A viewing request must not automatically trigger warehouse movement or product setup. For products marked Viewing on Request, the operational flow should be handled separately through a controlled appointment process: Customer Request -> Seller Approval -> Customer Confirmation -> Product Preparation -> Viewing.

Grouped viewing windows may be used so a seller can prepare a product once for several interested customers. No-show controls, reconfirmation and any future refundable viewing deposit belong to a separate Viewing & Appointment Logic standard, not to this product-data standard.

8. Warehouse Location

Warehouse Location - Recommended / Internal Operational Field. This identifies where the seller's inventory is physically stored. A separate Warehouse Availability field is unnecessary because Stock Status and Quantity Available already represent availability. Warehouse Location should normally remain internal and should not expose warehouse details to customers unless explicitly intended by the seller.

9. Delivery Availability

Value	Definition
Available	The Seller Offer can be delivered to the customer under the stated delivery conditions.
Pickup Only	The product can be purchased but delivery is not offered; customer pickup is required.
Not Available	No current delivery option is available for that Seller Offer.

10. Estimated Delivery Time

Estimated Delivery Time is required when Delivery Availability = Available. The seller should provide the most accurate current delivery expectation. Controlled MVP values:

Value	Meaning
Same Day	Expected delivery on the same day, subject to seller conditions.
1-2 Days	Expected within one to two days.
3-5 Days	Expected within three to five days.
5-7 Days	Expected within five to seven days.
More than 7 Days	Expected delivery exceeds seven days.
Seller Confirmation Required	A reliable delivery window cannot be confirmed until the seller reviews the order.

11. Delivery Cost

Delivery Cost is required when delivery is available. It must be recorded as either **Free** or as a confirmed monetary amount with currency. Delivery Cost is separate from Product Final Price and must not silently be included in or confused with the product price.

Example	Customer-Facing Pricing
Product Final Price	AED 2,960
Delivery Cost	AED 150
Total Payable	AED 3,110

For MVP recommendation logic, Final Product Price remains the core product budget-matching input. Whether Delivery Cost must also fit inside the customer's total budget will be defined later under Budget & Recommendation Logic.

12. Final Four Presentation

The Final Four should make practical purchase conditions immediately understandable. Where relevant, each offer should show its Final Price, stock state, physical viewing status and delivery information. On Display should be visually distinguished from Viewing on Request so the customer understands whether special preparation is required.

13. Record Ownership

Data	Primary Record
Stock Status / Quantity	AIO Seller Offer
Viewing Status / Viewing Location	AIO Seller Offer
Warehouse Location	AIO Seller Offer / internal seller operation
Delivery Availability / Time / Cost	AIO Seller Offer

Data	Primary Record
Canonical product identity and attributes	AID Product

14. Final MVP Rules

Stock Status: Required.
Quantity Available: Recommended; never guessed.
Low Stock: System-derived when reliable quantity exists.
Viewing Status: Required - On Display, Viewing on Request, or Not Available to View.
Viewing Location: Required when viewing is available.
Warehouse Location: Recommended and normally internal.
Delivery Availability: Required.
Estimated Delivery Time: Required when delivery is available.
Delivery Cost: Required when delivery is available and kept separate from Final Product Price.
