AID-DATA-012

PRODUCT IMAGES & MEDIA STANDARD

Practical MVP image rules for canonical product variants

1. Purpose

This standard defines the minimum image data required for AIDOOi product variants. The MVP approach must be practical for retailers: professional photography is not required. A clear mobile-phone photo can be used as the source and standardized by AIDOOi tools.

2. Image Ownership

Canonical product images belong to the **AID Product/Variant**. Each distinct variant - including a different colour variant with its own AID - must have images representing that exact variant. Multiple sellers offering the same canonical AID do not need duplicate product-image sets.

Record	Image Responsibility
AID Product / Variant	Canonical Main Image and Additional Images for the exact variant.
AIO Seller Offer	Optional seller-specific media only when useful, e.g. a real showroom/display image.
AIP Parent Product	Does not replace variant-specific images.

3. Minimum MVP Image Set

Image	Requirement	MVP Rule
Main Image	Required	One clear image showing the complete exact product variant.
Second View	Required	A different useful angle of the same exact variant.
Third View / Detail	Required	A third angle or a meaningful material/construction/detail view.
Lifestyle Image	Optional	Product shown in a furnished or styled environment.
Seller-Specific Image	Optional	Seller-owned contextual image such as the actual showroom display.

Minimum acceptable set: 3 images per AID Variant. More images may be added when useful, but they are not required for MVP onboarding.

4. Practical Capture Standard

Retailers may photograph products using a normal smartphone. A professional camera, studio or professional photographer is not required. Source images should be in focus, reasonably well lit, show the product clearly, and avoid unnecessary obstruction. The complete product should be visible in the Main Image.

5. White Background Standard

The canonical **Main Image must use a clean white background**. The retailer does not need to photograph the product against a white studio backdrop. AIDOOi may remove the original background and generate the standardized white background after upload.

Background processing may clean, crop, resize and optimize the image, but it must **not alter the real product**. Colour, proportions, materials, texture, construction and visible product details must remain faithful to the actual item.

6. Additional Images

Additional product images should also use a clean standardized presentation where practical. Background removal may be applied when it improves consistency. A Lifestyle Image is exempt because its purpose is to show the product in context.

AID-DATA-012

PRODUCT IMAGES & MEDIA STANDARD

7. Image Type

Each stored image should have an Image Type so the platform knows how it should be used.

Image Type	Use
Main	Primary canonical product image; exactly one active Main Image per AID Variant.
Alternate	Additional product angle.
Detail	Close-up of material, construction or another meaningful detail.
Lifestyle	Product shown in a room or styled setting.
Seller-Specific	Optional contextual media belonging to an AIO Seller Offer.

8. View Angle

View Angle - Recommended, not Required for MVP. Where known, controlled values may include Front, 3-Quarter, Side, Back, Top, Detail and Not Applicable. A 3-Quarter view is generally preferred for the Main Image when it communicates the product form well, but it is not mandatory for every category.

9. Image Source Type

AIDOOi should preserve transparency about the origin of an image. Recommended controlled values are **Real Photo**, **Manufacturer Render** and **AI-Generated Visualization**. AI-generated or rendered imagery must not silently replace the canonical representation of the real product.

10. Basic Quality Rules

Rule	MVP Standard
Capture device	Normal smartphone is acceptable.
Focus / clarity	Product must be clearly visible and not materially blurred.
Lighting	Sufficient to represent the product and its colour/material reasonably.
Main framing	Complete product visible; no important part unintentionally cropped.
Advertising overlays	No price stickers, promotional text or watermarks in the standardized canonical image.
Variant accuracy	Image must represent the exact AID Variant, including its colour/material variant.
Technical resolution	No burdensome professional-camera requirement; platform upload checks may enforce a practical minimum quality threshold.

11. Product Images vs Room Design Visualizations

AID-DATA-012 covers **individual product media only**. It does not define the complete room-design images used in AIDOOi's Final Four experience.

For a Studio Apartment, Dining Room, Bedroom or other room journey, AIDOOi may generate four complete coordinated design options showing multiple selected products together in each room visualization. Those Final Four design images belong to a separate **Room Design / Visualization** layer. After a customer selects a design, the individual AID products inside that design can then be opened and viewed separately.

12. Final MVP Rules

Per AID Variant: minimum 3 product images.
Main Image: required, exact variant, complete product, standardized white background.
Additional Images: minimum 2 required.
Lifestyle Image: optional.
Professional photography: not required; smartphone capture is acceptable.
Background: may be removed automatically and replaced with white.
Product integrity: image processing must not change the actual product.
Image Type: required per stored image.
View Angle: recommended.
Seller-Specific Media: optional at AIO level.
Final Four room renders: outside this standard and governed separately.
