AID-DATA-013

PRODUCT DESCRIPTION STANDARD

Customer-facing product descriptions generated from verified product data

1. Purpose

This standard defines the role and generation rules for Product Description in AIDOOi. Product Description is a presentation layer designed to help customers understand a product. It is not a primary decision-data layer for product matching, scoring or comparison.

2. Requirement Level

Field	Requirement	Rule
Product Description	Recommended	Absence of a description must not prevent a valid product from entering AIDOOi recommendations.

For MVP, structured product data is more important than manually supplied marketing copy. AIDOOi may generate a short description when sufficient verified structured data is available.

3. Source of Truth

Structured Data is always the source of truth. Product Description must not override or contradict verified fields such as taxonomy, dimensions, colour, material, style, price or availability.

Information	Authoritative Source
Product type / classification	Structured Taxonomy
Dimensions	Structured Dimension Fields
Colour	Structured Colour Fields
Material	Structured Material Fields
Style	Structured Style Fields
Price / availability	AIO Seller Offer Data
Description	Customer-facing explanatory text only

4. AI Matching and Scoring

Product Description should not be required as an input for AIDOOi matching, scoring or product comparison. Recommendation logic should use verified structured attributes. A missing description therefore does not reduce the product's eligibility when the required structured data is complete.

5. Description Generation

When a seller does not provide a suitable description, AIDOOi may generate one automatically from verified structured data. Seller or Admin review may be used when appropriate, but manual copywriting is not required for every MVP product.

Descriptions should normally be concise, natural and customer-friendly. As a practical guideline, approximately 2-4 sentences are sufficient for most products.

6. Permitted Content

May Include	Examples
Verified product identity and type	Lounge chair, coffee table, pendant light
Verified design characteristics	Open-frame silhouette, compact proportions
Verified materials / colours	Walnut, steel, beige upholstery
Verified style context	Contemporary, Japandi, Industrial
Useful customer interpretation	Visually light form, compact footprint - only when supported by verified data or clear observable characteristics

7. Prohibited Inference

AIDOOi must not invent product facts to make a description more attractive. If a feature is unknown or unverified, it should not be stated as fact.

Do Not Invent	Examples
Comfort claims	Extremely comfortable, ergonomic - unless supported
Material composition	Genuine leather, solid brass - unless verified

Do Not Invent	Examples
Performance / durability	Scratch-proof, waterproof, long-lasting - unless verified
Origin / craftsmanship	Handmade, Italian-made - unless verified
Availability / delivery claims	Ready today, immediate delivery - unless current AIO data confirms it
Marketing superlatives	Best quality, premium craftsmanship - unless governed by separate verified criteria

8. Seller-Provided Descriptions

Seller-provided text may be retained as source content, but AIDOOi may normalize, shorten or rewrite it for consistency. Marketing language must not be treated as verified structured product data. If seller copy conflicts with verified structured fields, the structured fields take precedence.

9. Example

Example generated description:
A contemporary lounge chair with a light, open-frame silhouette and relaxed proportions. Its sling-style seat and padded back create a casual seating character, while the slim metal frame keeps the overall appearance visually light.

The description communicates the product naturally, while exact dimensions, material classification, colour, price and availability remain in their dedicated structured fields.

10. Final MVP Rules

Product Description: Recommended, not Required.
Primary purpose: Customer presentation and understanding.
AI decision role: Not required for matching, scoring or comparison.
Generation: May be automatically created from verified structured data.
Source of truth: Structured fields always take priority.
Hallucination rule: Unknown or unverified product facts must not be invented.
MVP onboarding: Missing description must not block an otherwise complete product.
