AID-DATA-014

DATA STATUS & DATA QUALITY STANDARD

MVP quality-control rules for recommendation eligibility

1. Purpose

This standard defines the minimum data-quality workflow that determines whether a product record is ready to participate in AIDOOi recommendations. Its purpose is to prevent incomplete or unverified product data from entering the Recommendation Engine while keeping day-to-day seller operations practical.

2. Core Principle

A Product ID does not automatically make a product recommendation-ready. Required product data must be complete and the canonical product information must be verified by an AIDOOi Admin before the product becomes active for recommendation.

3. Data Status

Status	Meaning	Recommendation Eligible?
Incomplete	One or more Required fields are missing, invalid, or returned for correction.	No
Ready for Review	Required fields are complete and the product is waiting for AIDOOi Admin review.	No
Verified / Active	Required canonical data has been reviewed and approved by AIDOOi Admin.	Yes, subject to current AIO offer availability
Inactive	The record exists but has intentionally been removed from active recommendation use.	No

4. MVP Workflow

Seller enters or edits product data -> System checks Required fields -> Incomplete or Ready for Review -> AIDOOi Admin reviews -> Verified / Active.

If required information is missing, the system should assign or retain Incomplete automatically. A seller must not be able to bypass required-field validation and directly mark a product as Verified.

5. Verification Authority

Only an authorized AIDOOi Admin may set the canonical product to Verified / Active. Sellers may create, complete and correct their records, but final product-data verification remains under AIDOOi quality control for MVP.

6. What Verification Means

Verification confirms that the required canonical product fields have been reviewed for completeness and reasonable consistency. It does not mean AIDOOi independently certifies every manufacturer claim. Unverified or unknown facts must remain unresolved rather than being guessed.

7. Re-verification After Canonical Product Changes

Material changes to the canonical AID Product can affect matching accuracy. The following changes should automatically return a previously Verified product to **Ready for Review**:

Change	Re-verification
Product Classification / Taxonomy	Required
Dimensions	Required
Colour	Required
Material	Required
Style	Required
Main / canonical variant images	Required

8. Operational Offer Changes

Fast-changing commercial and operational AIO Seller Offer data should not require AIDOOi Admin re-verification after every update, otherwise normal retail operations would become impractical.

AIO Change	Admin Re-verification
Final Price / Original Price	Not required
Stock Status	Not required
Quantity Available	Not required

AIO Change	Admin Re-verification
Viewing Status	Not required
Delivery Time	Not required
Delivery Cost	Not required

9. Data Status vs Stock Status

Data Status and Stock Status are independent. For example, a product may be **Verified / Active** from a data-quality perspective while its current Seller Offer is **Out of Stock**. In that case the canonical data remains valid, but the unavailable offer should not be presented as a normal purchasable Final Four option.

10. Recommendation Eligibility

For MVP, a product should enter normal AIDOOi recommendation consideration only when its canonical data is **Verified / Active** and an applicable AIO Seller Offer satisfies the relevant commercial availability rules. Data verification alone does not guarantee current purchasability.

11. Final MVP Rules

Incomplete: Required data missing or correction required.
Ready for Review: Required data complete; awaiting AIDOOi Admin.
Verified / Active: Admin-approved and eligible for recommendation, subject to offer availability.
Inactive: Not used in active recommendations.
Verification authority: AIDOOi Admin only.
Canonical changes: Classification, dimensions, colour, material, style and canonical images trigger re-review.
Operational AIO changes: Price, stock, quantity, viewing and delivery updates do not trigger canonical re-verification.
