

UI Design System Standard

AID-DATA-015 | Revision 1 | MVP Standard

Purpose. This standard defines the visual identity and reusable UI design rules for AIDOOi. It is based on the approved AIDOOi logo direction and the supplied homepage design reference. It does not redefine customer journeys, recommendation logic or business rules.

Design direction: warm, premium, calm, intelligent and interior-led - with generous whitespace, deep navy structure, warm ivory surfaces and restrained beige accents.

1. Brand & Logo Direction

The approved logo direction uses the AiDOOi wordmark, deep navy structure and warm beige accents.

Element	Standard
Wordmark	Use the spelling **AiDOOi**. Both lowercase i characters must use the same visual construction and treatment.
Symbol	Use the rounded inverted-U / architectural arch form above the four-square window motif. Do not add the former eyebrow/roof mark above the four squares.
Tagline	YOUR INTELLIGENT INTERIOR ASSISTANT. Use as a secondary brand element, not as mandatory text on every screen.
Logo treatment	Prefer clean flat/digital artwork in the product UI. Embossed/3D presentation may be used for brand mockups and marketing visuals, not as the required interface rendering.
Clear space	Maintain generous clear space around the logo; do not crowd it with navigation, cards or imagery.
Distortion	Do not stretch, recolour arbitrarily, rotate or reconstruct the logo with inconsistent letterforms.

2. Core Colour System

The supplied design establishes a restrained navy, ivory and warm neutral palette. Exact production values should be stored as design tokens and remain consistent across the product.

Element	Standard
Primary Navy	#12345B - primary buttons, key headings, active states, important icons and navigation emphasis.
Accent Beige	#B7A78F - restrained highlights, secondary emphasis and warm brand accents.
Background Ivory	#FAF8F5 - primary page background.
Surface Warm Neutral	#F0ECE7 - cards, soft panels and secondary surfaces.
Primary Text	#1F2937 - body text where full navy would be visually heavy.
Secondary Text	#6B7280 - captions, helper text and lower-priority metadata.
Border / Divider	#E5E1DB - subtle borders and separators.

Element	Standard
White	#FFFFFF - controlled use for cards, input surfaces and contrast.

Primary Navy carries hierarchy; beige supports it. Beige must not compete with navy as the dominant action colour.

3. Typography

The reference UI combines editorial serif display headings with clean sans-serif functional text.

Element	Standard
Display / Hero Headings	Elegant high-contrast serif direction similar to the supplied homepage. Use for major marketing and section statements.
UI / Body Typeface	Clean modern sans-serif for body copy, navigation, labels, buttons, forms, prices and system information.
Hierarchy	Hero > Section Heading > Card/Product Heading > Body > Supporting/Metadata.
Readability	Decorative typography must never reduce readability of prices, dimensions, availability, product information or actions.
Capitalization	Use natural title/sentence case for UI. Reserve spaced uppercase for small brand labels or controlled section markers.

4. Buttons & Calls to Action

Actions should be visually obvious without creating a loud or overly commercial interface.

Element	Standard
Primary CTA	Filled Primary Navy, light text, rounded corners. Example: Find My Best Match / Get Started.
Secondary CTA	Warm neutral or outlined treatment with navy text.
Tertiary Action	Text link or subtle icon action.
Shape	Moderately rounded corners; avoid exaggerated pill styling except where the approved layout intentionally uses it.
States	Define Default, Hover, Pressed, Disabled and Loading states in implementation.
Action hierarchy	One clear primary action per major decision area whenever possible.

5. Cards, Inputs & Surfaces

Components should feel light, refined and spacious.

Element	Standard
Cards	Ivory/white/warm-neutral surfaces, subtle border or soft shadow, restrained radius.
Product Cards	Prioritize product image, Product Name, current price, match information where relevant, availability/viewing information and clear action.
Recommendation Cards	Visually distinguish Best Overall, Best Value, Best Style Match and Premium Choice without changing the core brand language.
Inputs	Simple bordered or softly filled fields with clear labels and comfortable spacing.
Selection States	Use navy border/fill/accent to make the selected option unmistakable.
Error States	Clear but restrained; accessibility and comprehension take priority over brand minimalism.

6. Iconography

Use a consistent simple line-icon family similar to the supplied homepage.

Element	Standard
Style	Minimal outline icons with consistent stroke weight and geometry.
Colour	Primarily navy; neutral backgrounds may be used behind icons.
Meaning	Icons support labels and should not replace essential text where meaning could be ambiguous.
Consistency	Do not mix filled, cartoon, photorealistic and outline icon families in the same interface.

7. Imagery Direction

Interior imagery is a major part of the AIDOOi experience and should support the premium but approachable identity.

Element	Standard
Photography	Warm natural light, realistic interiors, neutral/warm materials and uncluttered compositions.
Mood	Modern, calm, aspirational and livable rather than excessively staged or ultra-luxury.
Product fidelity	Where imagery represents a purchasable/recommended product, follow AID-LOG-011 product identity rules.
Background imagery	Ensure text and CTA contrast remains strong; use clear content zones rather than placing important copy over visually busy areas.
Consistency	Avoid random stock-image styles that break the warm interior-led visual language.

8. Layout & Spacing

The reference design relies on strong alignment, centered hierarchy and generous breathing room.

Element	Standard
Grid	Use a consistent responsive grid with aligned content edges and predictable card widths.
Spacing scale	Use a controlled spacing scale rather than arbitrary margins. Recommended implementation tokens: 4, 8, 16, 24, 32, 48 and 64 px.
Section spacing	Major sections require clear separation; dense dashboard-like packing should be avoided in the customer journey.
Alignment	Hero and explanatory sections may use centered alignment; product comparison/data-heavy areas may use left-aligned structures for readability.
Whitespace	Whitespace is a functional part of the AIDOOi visual identity and should not be treated as unused space.

9. Navigation & Customer Journey UI

Navigation should remain visually quiet so the furnishing journey and recommendations stay dominant.

Element	Standard
Header	Compact logo area, limited navigation items and one clear primary CTA where appropriate.
Journey steps	Use simple progressive screens/cards; avoid exposing backend complexity.
Progress	Where useful, show lightweight progress indication without making the flow feel like a long form.

Element	Standard
Consistency	SPC standards determine what is asked; this UI standard determines how those questions are visually presented.
Mobile	Navigation should simplify substantially on small screens rather than shrinking the desktop header.

10. Recommendation & Commerce Presentation

Commercial information must remain trustworthy, readable and subordinate to recommendation quality.

Element	Standard
Match information	Use clear labels and hierarchy for Match Score / recommendation tier without excessive badges.
Price	Current Selling Price must be visually clear. Original Price, where applicable, is secondary.
Availability	In Stock, viewing information and delivery information should be easy to locate.
Viewing	View-before-buy should have strong but not competing visual prominence relative to purchase.
Checkout	One Cart / One Checkout / One Payment experience should remain visually unified even when multiple Sellers are involved.
Seller identity	Seller information is available but should not visually overpower the AIDOOi recommendation experience.

11. Responsive Design

AIDOOi should preserve the same hierarchy and calm visual language across desktop, laptop, tablet and mobile.

Element	Standard
Desktop	1280 px and above - full layout and generous whitespace.
Laptop	1024-1279 px - reduced spacing while retaining hierarchy.
Tablet	768-1023 px - stacked or simplified component layouts.
Mobile	320-767 px - single-column priority, simplified navigation and touch-friendly controls.
Rule	Responsive behaviour must preserve content priority; it must not simply scale the desktop page down.

12. Accessibility & Consistency

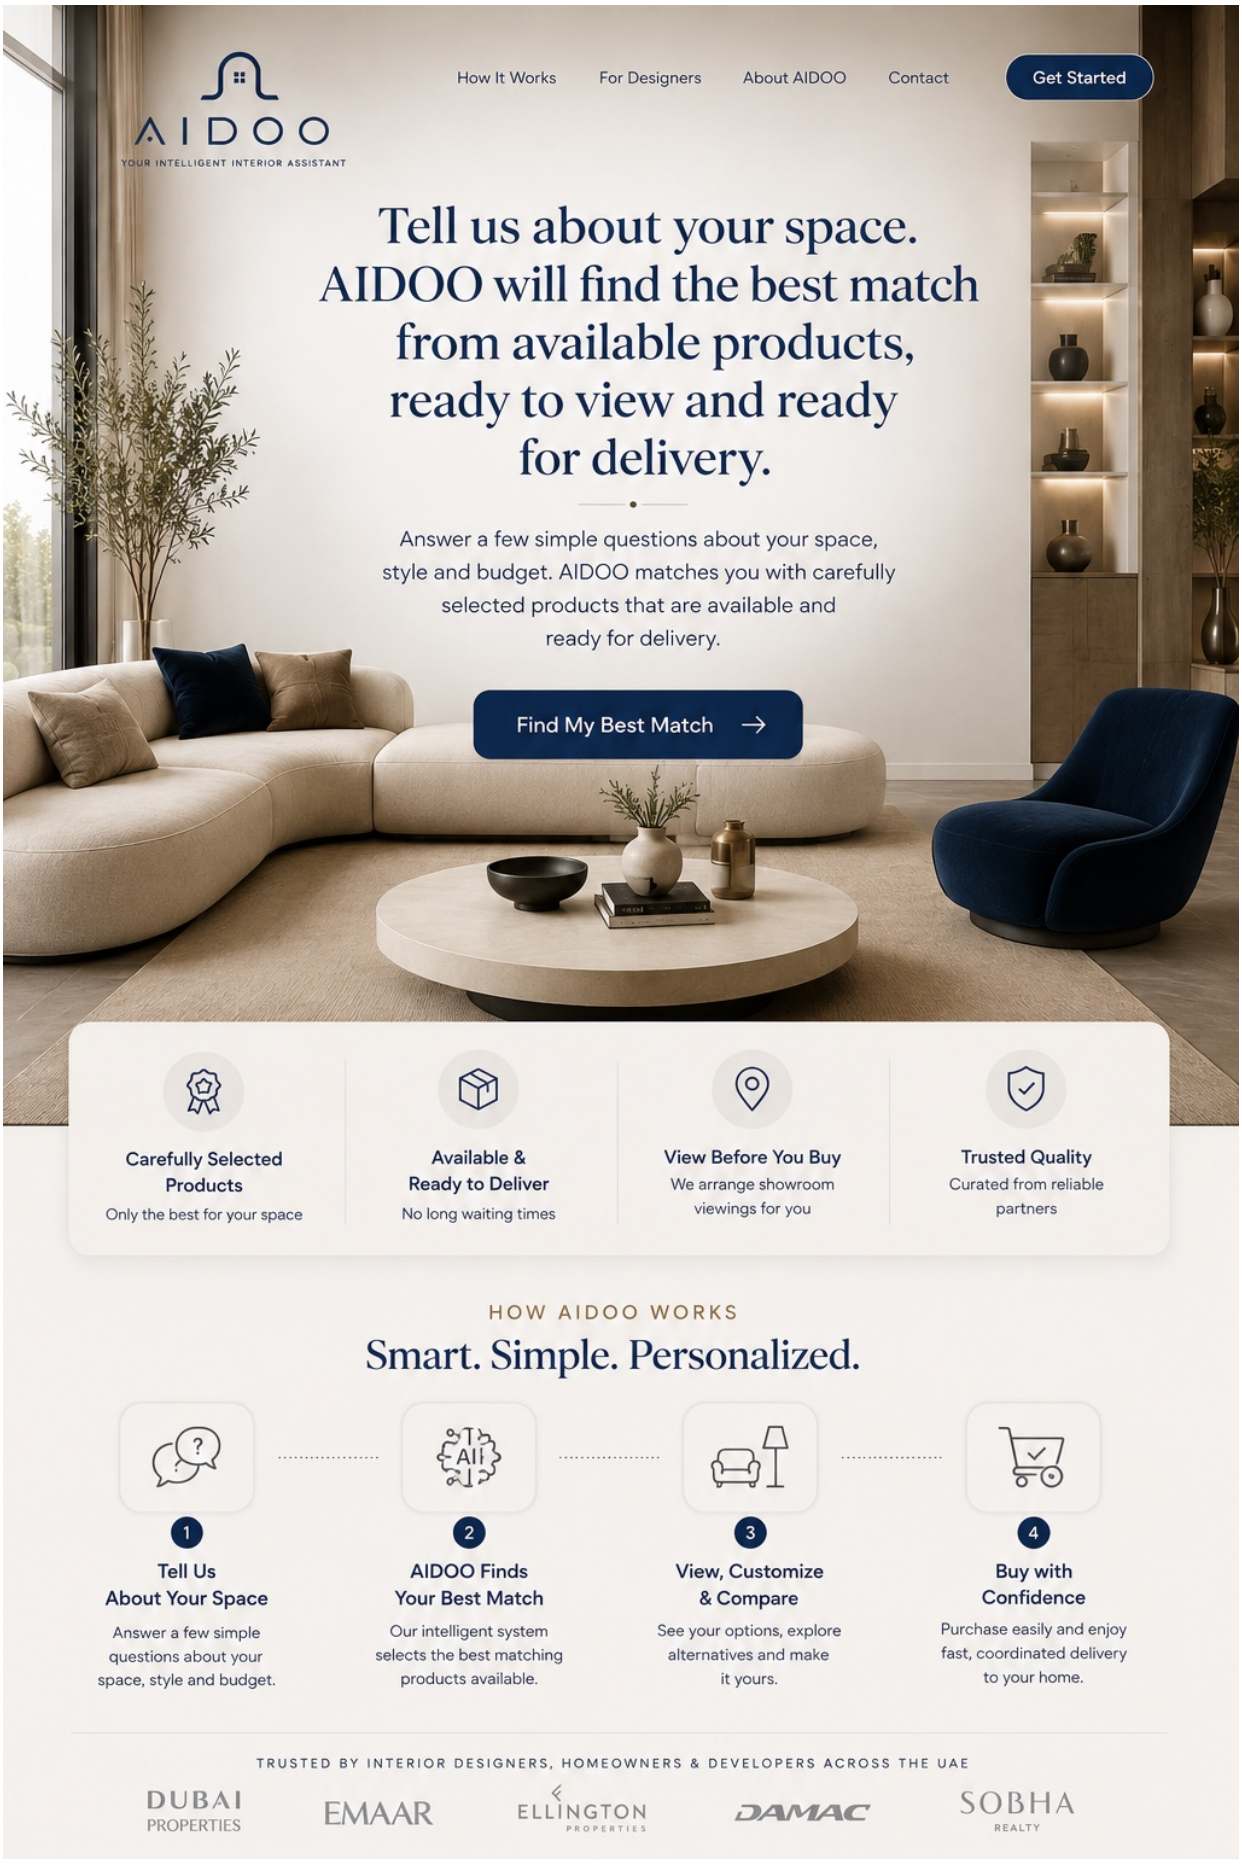

Premium minimalism must not reduce usability.

Element	Standard
Contrast	Maintain readable contrast for text, controls and interactive states.
Touch targets	Interactive controls must remain comfortably tappable on mobile.
Labels	Important inputs and actions require explicit labels.
States	Selected, disabled, error, loading and success states must be visually distinguishable.
Design tokens	Production UI should centralize colour, typography, spacing, radius, shadow and component-state values as reusable tokens.

Visual consistency is mandatory; business logic remains governed by the applicable SPC, CAT and LOG standards.

Visual Reference

Approved homepage direction supplied for AIDOOi MVP

Reference interpretation: This image establishes the intended visual character - warm ivory background, deep navy typography/actions, restrained warm neutral accents, premium interior photography, editorial headings, clean iconography

and generous spacing. Individual screen layouts may evolve as long as the design system above remains consistent.

Final Principle: AIDOOi should feel intelligent and premium without feeling technical, cold or visually complicated.
