User, Partner & Product Administration Logic

AID-LOG-013 | Revision 1 | MVP Standard

Purpose. This standard defines the MVP access and administration model for AIDOOi users, partner stores and product-data operations. It keeps the customer journey low-friction while centralizing partner approval and product-data quality under AIDOOi control.

AIDOOi keeps customer access friction low while maintaining centralized control over partner approval and product data quality during the MVP stage.

1. User Registration & Access Logic

All customer-facing users follow the same AIDOOi journey during MVP. No separate Designer journey or professional account path is required.

Rule / Element	MVP Requirement
Guest-first access	A user may enter AIDOOi and complete the discovery and recommendation journey without creating an account.
Available before registration	Profiling, recommendation generation, visualization, product details and product replacement may be used before registration.
Registration trigger	Sign Up / Sign In becomes mandatory only when the user selects Request Viewing or Request Purchase.
Action continuity	After successful Sign Up / Sign In, the user must return directly to the action that triggered registration rather than restarting the journey.
Designer treatment	Designers use the same customer-facing journey during MVP. A separate Designer role, onboarding flow or professional workspace is outside MVP scope.
MVP principle	Do not introduce registration earlier than required for a real viewing or purchase action.

Explore first. Registration is required only when the user requests a physical viewing or initiates a purchase request.

2. Partner Store Onboarding Logic

Partner stores do not receive a self-service Seller Portal during MVP. The public-facing partner journey is intentionally limited to a simple collaboration request.

Rule / Element	MVP Requirement
Entry point	Provide a separate Partner with AIDOOi page.
Initial information	Collect only basic partnership-contact information: Store / Brand Name, Owner / Manager Name, Address, Phone Number and Email.
Primary action	The form ends with a single Request Partnership submission action.
Submission result	The request is received by the AIDOOi team for internal review and follow-up.
Human follow-up	AIDOOi contacts the store directly after submission.
Partnership agreement	Commercial and operational cooperation is established through a separate agreement outside the public request form.

Rule / Element	MVP Requirement
No automatic activation	Submitting the form does not automatically create an active Partner or grant access to product administration.
No Seller Portal	Seller Dashboard, self-service onboarding and direct product management are outside MVP scope.

The MVP partner form is a collaboration request, not an automated seller-registration or seller-activation process.

3. Product Administration & Publishing Logic

All creation and governance of product data is controlled by AIDOOi Admin and authorized AIDOOi specialists during MVP.

Rule / Element	MVP Requirement
Partner role	The Partner provides catalogues, product information, images and relevant commercial/operational information to AIDOOi.
Product creation	Partners do not directly create products in the AIDOOi system.
Classification & standardization	AIDOOi specialists classify and standardize products according to the applicable AID-DATA and AID-CAT standards.
Canonical management	AIDOOi controls Canonical Product matching/creation, Parent/Variant relationships and AID Product identity.
Seller offer creation	AIDOOi creates and links the applicable AIO Seller Offer to the canonical AID Product.
Verification	Only AIDOOi Admin / authorized specialists verify product data for publication.
Publishing	Partners cannot directly publish or activate products during MVP.
Operational updates	Price, Stock, Viewing Status, Viewing Location and similar operational information originate from the Partner but are maintained in AIDOOi by the AIDOOi team during MVP.
Data quality	No Partner-supplied information becomes recommendation-ready merely because it was submitted; it must satisfy the applicable AIDOOi data-quality and eligibility rules.

All product creation, classification, standardization, canonical management, verification and publishing are performed by AIDOOi Admin or authorized AIDOOi specialists during MVP.

4. MVP Roles & Permissions

The MVP intentionally uses a small permission model.

Rule / Element	MVP Requirement
Guest User	May explore, profile, receive recommendations, view visualizations and inspect/replace recommended products.
Registered User	Receives Guest capabilities plus the ability to submit Request Viewing and Request Purchase actions.
Partner Store	May submit a partnership request and provide product/commercial information to AIDOOi through the agreed operational process; no direct product-system access is required.
AIDOOi Admin / Specialist	Controls partner activation, product-data creation, standardization, verification, publishing and operational product updates.
Designer	No separate system role for MVP; follows the same journey as other users.

The MVP should add roles and permissions only when they are required by an actual customer, partner or data-governance workflow.

5. MVP Flow Summary

The three administration flows remain separate but coordinated.

Rule / Element	MVP Requirement
User flow	Guest Journey -> Recommendation -> Visualization / Product Interaction -> Request Viewing or Request Purchase -> Sign Up / Sign In -> Continue Requested Action.
Partner flow	Partner with AIDOOi -> Basic Information -> Request Partnership -> AIDOOi Review / Contact -> Separate Agreement -> Partner Activation.
Product flow	Partner Source Data -> AIDOOi Data Entry -> Classification / Standardization -> Canonical AID / Variant Management -> AIO Offer Creation -> Verification -> Active / Published.

Customer access remains open until action is required; partner access remains controlled; product data remains centrally governed.

6. Standard Boundaries

AID-LOG-013 defines **when access is required, how partner requests are handled, and who controls product administration**. The detailed definition of stored fields remains in the applicable AID-DATA standards. Product taxonomy and practical attributes remain in AID-CAT standards. Recommendation, viewing and transaction decisions remain in their applicable AID-LOG standards.

Final Principle: MVP simplicity must not weaken product-data governance. AIDOOi can keep user and partner onboarding lightweight because the AIDOOi team retains direct control of the product information that powers recommendations.
